

Current Setup

Homelab Hardware & Server Overview

My home lab currently consists of two machines — a main Windows PC for day-to-day use, and a repurposed HP OMEN laptop running headlessly as a Linux server.

Only the servers get names — a naming convention chosen by my niece — powerful supernatural female anime characters. It started as a joke. It stuck.

Main PC

- Intel Core i7-14700
- 32GB RAM
- Nvidia GeForce RTX 4070 Ti Super

nezuko (*Nezuko Kamado — Demon Slayer*)

- HP OMEN Laptop, running headlessly
- Intel Core i7-10750H
- 16GB RAM
- Nvidia GeForce RTX 2060 Mobile
- OS: Ubuntu 26.04 LTS
- Running: Jellyfin, Docker, Tailscale, SSH

Coming Soon

- **MilimNava** — Raspberry Pi 5 8GB (*Milim Nava — That Time I Got Reincarnated as a Slime*)
- **shalltear** — Beelink EQ12 Mini PC running Proxmox (*Shalltear Bloodfallen — Overlord*)

Looks like all my servers will be run by Demon Queens. Yikes.
